

EzPro T56, the Best in Professional Amplification

Everyday noise levels have soared in recent decades. The constant buzz of the workplace, the beats bursting out of MP3 players, and the roaring engines on our cars and motorcycles can lead to troublesome hearing loss over time. But why accept the frustration of not being able to clearly hear your friends and family over the phone? Here at Fanstel, we've developed innovative solutions to ensure that next phone call will be strain-free.

Natural aging plus excess noise affects a person's ability to hear higher frequencies. And it is precisely these higher frequencies that are often most important for correctly hearing what people are saying! **For example, if a patient is unable to hear frequencies above 2500 Hz, he may confuse the letter 'T' with 'P' and 'K', and the letter 'F' with 'S'.**

In the chart, we show how Fanstel's EzPro T56 offers better amplification than the leading model XD, where you need it most. **At frequencies greater than 2500Hz, the EzPro T56 continues to deliver more amplification, where XD amplification starts to quit.** Furthermore, the EzPro T56 smoothly ramps up the volume boost, which means none of the distortion you'll get from other models. The seamless 56dB boost sounds so natural, the sound quality so crisp, you'll wonder why you ever settled for another phone!

EzPro T56 is not only the easy choice at the store, but the natural choice in your home. So go ahead and treat yourself to the most advanced, professional grade sound enhancement technology, now available in the comfort of your own home!
